

# Digitisation and Role of IoT for Next Generation Enterprise

Thursday, 25<sup>th</sup> May 2017, Hotel Shangri-La's - Eros, New Delhi

# Overview

The Internet of Things (IoT) is becoming a major transformative opportunity for enterprises. Many enterprises have started their IoT journey but most of them are yet to move beyond pilots to create enterprise-level transformative IoT strategies.

IoT is bringing huge benefits to organizations who have taken the plunge, and many more desire this. Enterprises are seeing benefits if their organization were able to increase their use of IoT but organizations are facing challenges in terms of scaling, security and interoperability. While most organizations are adopting IoT, many of the early adopters are not taking the right path to overcome the challenges that they face.

The use of technology can be the key differentiator between similar organizations by enabling efficiencies, analysis and cost reductions. In turn, this can help retain customers and attract new customers, while increasing market share. In particular, the utilisation of IoT can enable digital transformation and result in huge gains. This can be through business efficiency, new products or increasing financial opportunities. These benefits should be enough to drive investment now.

IoT is not going away and the sooner organizations can move forward with their adoption the better. They need to see this opportunity and take it. If they do not, then their competitors will.
